

Germa White Line Vacuum Pillows

Germa Vacuum Pillows provide you with customised, semipermanent stabilisation, positioning and/or fixation for many situations where you can make benefit of these features and functions. The pillow reads your body part and even out the weight on the whole area where your body is in contact with the pillow and with this takes away the risk of pressure points, evacuate the pillow and you have a stable positioning or fixation still with very limited risk of pressure points or wounds.

Indented use:

- * Stabilisation, support and fixation of a patient on surgery table
- * Stabilisation of a child and adults with different types of disabilities or deformities
- * Fixation of body parts during surgery e.g. hand or eye surgery to make sure of a fixated patient during treatment or/and preliminary X-ray, CT or MRI

When air is evacuated by use of e.i. the one-hand-operated vacuum pump, the pillow becomes stable in the chosen form and stiffness. When the valve is released, allowing air into the pillow, the Germa Vacuum Pillow regains its flexibility and is ready to be reshaped again.

Pillow can be closed to accommodate structural deformations and is also appropriate for temporary posture correction.

Specification:

Germa Vacuum Pillows are made of PVC-film or PVC coated fabric with vacuum valve.

Inner bag in nylon. Granules of polystyrene.

Germa Vacuum Pumps are made of aluminium and robust plastic.

The bigger foot rest vacuum pump has a higher degree of efficiency especially for larger vacuum pillows.

Product information

- Can be shaped and reshaped in seconds
- Density and firmness can be easily adjusted
- Durable, strong blue PVC - film in shell, easy to clean and disinfect for multiple client use
- To support at dental care and surgery as fixation and stabilisation of patient
- Fixation at hand-, eye- and general surgery
- Tool for fixation at preliminary
- To support
- Stabilisation of children and adults with different types of disabilities.
- Fixation at hand-, eye- and general surgery
- Tool for fixation at preliminary x-ray
- When air is evacuated by use of e.i. the one-hand-operated vacuum pump, the pillow becomes stable in the chosen form and stiffness. When the valve is released, allowing air into the pillow, the Germa Vacuum Pillow regains its flexibility and is ready to be reshaped again. The Vacuum Pillow forms a firm support for most parts of the body uniformly, with weight evenly distributed, reducing the risk of pressure points. Can be used to accommodate structural deformities and is also appropriate for temporary posture correction.
